

## HYDROXYAPATITE TOOTHPASTE

A great, fluoride-free alternative towards cavity prevention

### What is Hydroxyapatite?

Hydroxyapatite is naturally present in our body and makes up about 97% of tooth enamel, 70% of dentine, and 60% of bones.

Hydroxyapatite remineralizes teeth by replacing lost minerals like calcium and phosphates. Remineralisation occurs when these minerals fill up the microscopic gaps in our tooth structure created by tooth decay or high levels of acid. This not only strengthens the teeth and prevents cavities but may also reverse early demineralization.

### Is it safe?

As it occurs naturally within our bodies, HAP is considered biocompatible and safer than many other dental products. Being non-toxic, there are no concerns with ingestion through accidental swallowing or overexposure.

### Instructions for Use

- Brush twice/day for 2 minutes each time.
- Do not rinse your mouth after brushing.
- Avoid eating or drinking immediately after use.
